

Dosing, mixing and dilution!

Mixing various ingredients **by the recipe** of the final product, together with keeping the **required proportion, precision, and order**. This is a challenge for most industrial producers.

The In-line Blending System was created exactly for this application. It makes the production **automatic, produces exactly by the recipe**, and requires no human work. It is precise and it **records every operation**.

The In-line Blending System is based on the **machine used to dilute thick liquids**, like SLES. However, it was designed in a **modular way**. Thanks to that, we can easily **configure the system to the actual needs** for production. The ingredients of the final product can be **supplied from various types of tanks**.

Examples of the supply tanks

Storage tank

IBC container

Drum

Customized tanks
